

## Homework Set #3

1. (10 points) Exercise 4.3-4 (page 75)
2. (40 points) Exercise 4-1 (page 85)
3. (30 points) Pseudo-code Analysis: For the pseudocode below for *Mystery*, find a tight upper bound on its worst-case asymptotic running time  $T(n)$ , where  $n$  is the length of the portion of array  $A$  that is processed by *Mystery*. That is, find  $g(n)$  such that  $T(n) \in O(g(n))$ , where  $n = \text{right} - \text{left} + 1$ . You may assume that  $n$  is a power of 2. Justify your answer.

```

Mystery( $A, k, \text{left}, \text{right}$ )
  if  $\text{left} = (\text{right}-1)$ 
    then if  $A[\text{left}] = k$ 
      then print "Match for "  $k$  " found at position"  $\text{left}$  " ."
      return  $k$ 
    if  $A[\text{right}] = k$ 
      then print "Match for "  $k$  " found at position"  $\text{right}$  " ."
      return  $k$ 
    return  $-1$ 
   $sDouble \leftarrow \sqrt{\text{right} - \text{left} + 1}$ 
   $s \leftarrow \lfloor sDouble \rfloor$ 
  for  $i \leftarrow 1$  to  $s$ 
    do  $\text{leftI} \leftarrow \text{left} + (i-1) * s$ 
        $\text{rightI} \leftarrow \text{leftI} + s - 1$ 
        $\text{result} \leftarrow \text{Mystery}(A, k, \text{leftI}, \text{rightI})$ 
    if  $\text{result} \neq -1$ 
      then return  $\text{result}$ 
  return  $-1$ 

```
