

Due Date: Dec. 7, 2018 (F), **BEFORE** the class begins

This assignment covers textbook Chapter 11 and Chapter 1~8.

1. Hash Table (20 points)

Exercises 11.2-1, page 261

2. Hash Function (45 points, 15 for each sub-question)

Consider inserting keys 3,4,2,5,1 in the order given into a hash table of length $m = 5$ using hash function $h(k) = k^2 \bmod m$ (k^2 is the auxiliary function).

(1) Using $h(k)$ as the hash function, illustrate the result of inserting these keys using chaining. Also, compute the load factor α for the hash table resulting from the insertions.

(2) Using $h(k)$ as the primary hash function, illustrate the result of inserting these keys using open addressing with linear probing.

(3) Using $h(k)$ as the primary hash function, illustrate the result of inserting these keys using open addressing with quadratic probing, where $c_1=1$ and $c_2=2$.

3. Hash Function (15 points)

What different values can a hash function $h(k) = k^2 \bmod m$ produce when $m = 5$? Assuming k is a natural number. Carefully justify your answer in detail.

4. Algorithm Design (20 points)

Consider an unsorted array A of n non-negative distinct integers, design an algorithm to determine if the array contains two integers such that they add up to a specific target number s . That is: if we can find $A[i] + A[j] == s$ ($1 \leq i, j \leq n, i \neq j$), s is an integer, the algorithm should return TRUE, otherwise return FALSE.

Design requirement: the algorithm you are going to design should provide a linear running time, rather than a $O(n^2)$ running-time brute-force solution or a $O(n \lg n)$ solution (you may want to think how to get an $O(n \lg n)$ solution). You may use the algorithms that we learned in the textbook.

(1) Write the Pseudo-code (*please use textbook conventions*) (15 points)

(2) Justify the running time of the algorithm and also discuss the space requirement for your algorithm (5 points).

Must be attached to each submission

Academic achievement is ordinarily evaluated on the basis of work that a student produces independently. Infringement of this Code of Honor entails penalties ranging from reprimand to suspension, dismissal or expulsion from the University.

Your name on any exercise is regarded as assurance and certification that what you are submitting for that exercise is the result of your own thoughts and study. Where collaboration is authorized, you should state very clearly which parts of any assignment were performed with collaboration and name your collaborators.

In writing examinations and quizzes, you are expected and required to respond entirely on the basis of your own memory and capacity, without any assistance whatsoever except such as what is specifically authorized by the instructor.

I certify that the work submitted with this assignment is mine and was generated in a manner consistent with this document, the course academic policy on the course website on Blackboard, and the UMass Lowell academic code.
